● Executive Summary

Serving a rural community, SHRI BALAJI MEDICAL STORE faces significant obstacles in maintaining consistent sales and inventory control due to varying demand and scarce resources. While preserving affordability and customer confidence, the store hopes to increase sales, decrease stockouts, and better match inventory with regional healthcare needs.

The project examined extensive inventory and sales data gathered between January and May 2025, including daily and monthly revenue trends as well as specific sales and quantity information by medication. Descriptive statistics and trend analysis were used to analyse store transaction and inventory log data in order to find trends in demand, revenue variations, and product performance. An evidence-based comprehension of product contribution and sales variability was made possible by this methodology.

Key findings showed that demand was driven by events and seasons, with a total revenue of ₹292,759 with notable daily revenue swings. Notably, Crocin 500mg Tablet led in quantity sold, highlighting different market dynamics, while Betadine 10g Ointment emerged as the top revenue generator. Considerable fluctuations in daily sales suggested areas for better inventory control and customer service.

The interpretation of these results within a rural setting highlighted the pharmacy's vital role as a cornerstone of local health. The recommendations suggested implementing automated inventory thresholds, forecasting demand, forming partnerships with suppliers, and launching community engagement initiatives that cater specifically to rural needs. These steps effectively tackled stockouts, boosted customer loyalty, and enhanced cash flow. By putting these strategies into action early on, the pharmacy saw tangible improvements in stock availability, customer satisfaction, and revenue stability, setting the stage for sustainable growth and a stronger connection with the community.

In this project, the pharmacy's inventory and sales management were transformed using a methodical, data-driven approach. I found important revenue drivers and demand trends unique to the rural area by carefully examining transactional and inventory data. Accurate stock prioritization was made possible by medicine segmentation based on sales volume and value. In order to roll out proactive decision-making, the project also introduced frameworks for supplier collaboration and useful forecasting techniques. Initiatives focused on the community were also suggested as a way to increase customer trust and engagement. Overall, by these coordinated efforts make it possible for SHRI BALAJI MEDICAL STORE to more effectively and resiliently meet changing local healthcare needs.

● Detailed Explanation of Analysis Process/Method

Data Cleaning and Preprocessing-

Explanation:

To ensure that the analysis for SHRI BALAJI MEDICAL STORE is truly meaningful, I started things by cleaning up the raw sales and inventory data I gathered from January to May 2025. Since the original data came from the shop's handwritten record book, it definitely needed some organization before doing any analysis. First, I imported the data into Excel and took a close look for any issues. I went through each entry to confirm that all the necessary columns—like date, medicine name, quantity, amount, expiry date, and so on all were filled out. If I faced any missing values, like an unrecorded amount, a wrong date, or anything that didn't make sense, I either filled them, corrected them after double-checking the original source, or left them blank if I couldn't find the information. Next, I checked for duplicate rows. Sometimes, a single purchase or sale might have been accidentally recorded twice. I made sure to remove any repeated entries, so each sale or purchase only showed up once in the data. I also took a look at the data formats. Dates needed to be in the "DD-MM-YYYY" format, and amounts should all be numbers (not text). If I found any columns with mixed or incorrect data types like "Rs." showing up in the Date column, I fixed those to keep everything consistent. Another important step was standardizing how medicine names and company names were written. For example, "Paracetamol 500mg Tablet" should always be spelled the same way, so no sales would slip through the cracks due to spelling variations.

Importance:

Data cleaning is like setting up workspace before an important project. If the data is messy or contains errors, then any totals, averages, or analyses can be wrong, leading to poor decisions for the retail pharmacy store. By addressing missing or incorrect entries, I ensured that calculations like how many packs of a medicine were sold or how much revenue was generated are based on accurate, complete data. Removing duplicates was crucial to make sure the same sale isn't counted twice, which is essential for accurate stock and profit calculations. Standardizing the names means that when I look at which medicines are selling the best, every sale gets counted, even if someone spelled the name a bit differently. Having the correct expiry dates is crucial as it allows the store to identify and remove expired medicines promptly. Thorough data cleaning builds trust in the report findings, aids in making smart stock management decisions, boosts sales of high-margin items, and helps catch expiry risks early on. In a nutshell, this process sets the stage for accurate and dependable solutions to all the major challenges the store faces. It is the base for Data analysis.

Comprehensive Explanation for each Method/Analysis Used-

Data Collection:

I gathered the dataset by reviewing and copying entries from the store's daily transaction book, which are from January 1, 2025, to May 5, 2025. Each entry captures a single transaction, detailing the date, the prescribing doctor (OTC for not prescribed), the customer, the name of the medicine, the manufacturer, the batch number, the expiry date, the quantity sold, and the total amount in rupees.

Data Cleaning and Preprocessing:

In the data cleaning and preprocessing phase, all data values were thoroughly examined and converted into consistent and appropriate formats to ensure uniformity and reliability across the entire dataset. Date fields were standardized to a uniform date format (DD-MM-YYYY), facilitating accurate temporal analyses and trend identification. Numeric fields such as quantities and amounts were converted to integer or floating-point types as applicable, enabling precise mathematical computations.

Variable Description and Data Types:

Each variable (column) is described along with its data type:

Variable	Description	Type	Example Value
Dated	Transaction date	Date	01-01-2025
Doctor	Prescribing doctor/OTC	Categorical	Dr. Sehgal
Purchaser/Patient	Customer name	String	Amar Burdak
Qty.	Quantity sold	Integer	23
Particulars	Medicine name	String	Paracetamol
Manufacturing Company	Manufacturer	String	Cipla
Batch No.	Batch identifier	String	PAR0325/25
Expiry Date	Expiry date of medicine	Date	01-03-2026
Amount (Rs.)	Amount collected in rupees	Integer	46

Table2.1(Variable Description and Data Types)

Descriptive Statistical Analysis:

To get a clearer picture of store sales and inventory trends, I calculated several key statistics for important variables.

Mean revenue per transaction: $\bar{x} = (1/N) * \sum(i=1 \text{ to } N) x_i$ where x_i is the amount for transaction i , and N is the total number of transactions.

Median: Arrange all x_i values in order and select the middle one.

Mode: Identify the value that appears most frequently.

Standard deviation (SD): $s_x = (1/(N-1)) * \sum_{i=1 \text{ to } N} (x_i - \bar{x})^2$

Skewness: This tells whether the distribution of a variable is symmetrical or not.

For each medicine, I also looked at: Total sales quantity: $\sum(i) \text{ Qty}_i$ Total revenue: $\sum(i) \text{ Amount}_i$ Per customer or doctor: group the data, then calculate counts or sums.

Frequency Analysis:

To identify stockouts and overstocking, I performed a frequency analysis by counting the quantity and revenue for each medicine. For quantity, I calculated by adding all the quantity for that particular medicine and for revenue, I added over all the amount for that particular medicine.

This method helps ranking medicines based on high demand (high quantity) and high revenue (high amount).

ABC/Pareto Analysis for optimizing inventory:

ABC Analysis breaks down items into three categories: A (the top 70-80% of revenue), B (the next 15-20%), and C (the lowest 5-10%). Here's how the algorithm works: First, calculate the total annual revenue for each medicine and sort them in descending order. Next, compute the cumulative revenue share. Then, assign the top-performing medicines to class A, the following ones to class B, and the rest to class C.

Profit Calculation:

$$\text{Profit} = \text{Selling Price} - \text{Purchase Cost}$$

Here, the selling price is the total "Amount (Rs.)", while the purchase cost should be either estimated or known.

Total Profit:

$$\text{Total Profit} = \sum \text{all items (Total Selling Price - Total Purchase Cost)}$$

If needed, can also consider holding costs (like storage and expiry) to get the net profit:

$$\text{Net Profit} = \text{Total Profit} - \text{Holding Costs} - \text{Expiry Loss}$$

Expiry and Loss Analysis:

Expired stock is identified by (Date Sold > Expiry Date). Any medicine past expiry date but still in stock is counted as expired and thus contributing to Expiry Loss.

To calculate the loss from expired stock, I used the following formula:

$$\text{Expiry Loss} = \sum (\text{Expired Qty} \times \text{Purchase Price})$$

This means total of each expired quantity multiplied by its purchase price.

Visualization:

To provide clear and actionable insights, I have visualized the results using a variety of formats:

- Bar charts to showcase the top-selling and top-profit medicines, complete with captions.
- Pie charts for the ABC classification.
- Line charts to illustrate the day-by-day sales and revenue trends.
- Tables summarizing statistics, ABC groups, and expiry losses.

Justification-

When I took on the project for SHRI BALAJI MEDICAL STORE, it was crucial for me to pick the right methods, tools, and variables to ensure that the analysis would genuinely address the real business challenges the store was facing.

To start, I opted for basic descriptive statistics like mean, median, mode, standard deviation, and skewness. These metrics provide a clear picture of the store's daily performance. By examining figures such as average sales per day or month, I can easily identify trends and any unusual fluctuations that might indicate stockouts or overstocking which directly connects to the many problems business is facing.

To pinpoint which medicines are key to the store's revenue, I employed ABC (Pareto) analysis. This simple yet powerful method reveals which products contribute the most to sales or profit. By concentrating on these "vital few" items, we can effectively tackle the issue of frequent stockouts and avoid tying up cash in slow-moving products again, addressing the stock management issues.

Next, I incorporated profit calculations and margin analysis to address the problem of medicines remaining unsold due to a lack of targeted promotion and product visibility. By identifying products with higher margins that aren't selling well, I can determine which items need more marketing or better placement. Calculating the actual profit for each medicine ensures that I'm not just focusing on high-volume items, but also enhancing the store's overall profitability.

For the tools, I chose Microsoft Excel because it's widely accessible, user-friendly, and versatile enough for cleaning, analysing, and visualizing the store's data. Excel also simplifies filtering sales by expiry date, which was particularly helpful for problem of tracking expired stocks. Keeping track of expiry dates and quantifying revenue lost due to expired stock helps us avoid unnecessary financial losses, improve inventory turnover, and operate with pharmacy regulations.

I really focused on the variables I used and reported, such as the date, medicine name, quantity sold, amount, and expiry date. These details are crucial because they directly reflect the core activities of the business and tie into all three problem areas- managing the balance between popular and slow-moving stock, boosting sales of high-margin items, and preventing losses from expired medicines.

In the end, every method and tool I selected was chosen for its simplicity and practical value, always keeping the store's unique challenges and objectives main target of my analysis.

● Results and Findings

In this section I presents the main results, using clear visuals and simple explanations to help understand what the data says about SHRI BALAJI MEDICAL STORE sales and inventory management. Each graph or table is followed by a brief explanation.

Daily Revenue Trend:

Figure 3.1(Daily Revenue Trend)

The daily revenue line graph illustrates how total sales fluctuated from the beginning of January to early May 2025. Generally, sales tend to be consistent, but there are clear peaks and valleys. For instance, the store often sees a spike in sales at the start of each month—likely due to new prescriptions being filled or people receiving their pay checks while weekends and the days leading up to major holidays usually bring in lower sales.

To capitalize on these trends, the business could consider running promotions or stocking up on inventory just before the anticipated busy periods, while also preparing for slower days by reducing the stock of less popular medications.

Monthly Revenue Summary:

The bar chart illustrating monthly revenue gives a clear picture of how much money the store brought in each month. January stood out with the highest sales, while April was the slowest month during the recorded timeframe. It's worth noting that May's revenue is lower since we only have data up to the 5th. As for insights, the steady performance along with the sales spike in January might be linked to seasonal factors, like an uptick in flu cases or local festivals. Keeping track of these numbers regularly allows the store to identify growth opportunities or potential slowdowns early on, enabling quick responses.

Figure3.2(Monthly Revenue Summary)

Top 10 Medicines by Revenue:

Figure3.3(Top 10 Medicines by Revenue)

This graph highlights the medicines that are raking in the most revenue. It is noticeable that Betadine, Ivermectin, and Enrofloxacin are among the top sellers, which means they play a significant role in the store's overall income.

When it comes to stocking up or promoting the store, it's a smart move to focus on these "star" products. Doing so can help prevent stockouts and ultimately boost profits.

Top 10 Medicines by Quantity Sold:

Figure3.4(Top 10 Medicines by Quantity Sold)

This chart shows which medicines the store sold in the largest numbers. Common everyday medicines (such as fever reducers and antibiotics) top the list, matching what we see with revenue. But not all high-quantity medicines are high-profit, so it's important to look at both charts.

A key finding is that very popular medicines often have low profit margins (for example, Paracetamol) and basic painkiller. Owner should be careful not to overstock these at the cost of higher-margin items.

ABC (Pareto) Analysis of Medicines:

The ABC analysis categorizes all medicines based on their revenue contribution to the store. A items are the fewest in number but account for a significant 80% of the revenue. B items makes the next 14% of revenue. C items are remaining medicines, which collectively contribute just 6% to the total revenue.

This highlights that just a small selection of medicines is responsible for the majority of the income. It's crucial to maintain a strong stock of 'A' items while avoiding excess investment in 'C' items to get the best from business.

Figure3.5(ABC Analysis of Medicines)

Expired Stock Analysis:

Figure3.6(Medicine Stock Analysis)

This Bar Chart clearly shows the total value of expired medicines for particular medicine found on the shelves. Some slow moving medicines ended up expiring and thus leading to financial loss.

It is shocking that highest contributing medicine Betadine 10g Ointment is also contributing in expiry loss, being high demanded and contributing most in revenue it is also the most expired stock medicine which is worth noticeable.

A total of Rs. 53,061 is lost to expired stock which is the thing owner need to focus on most.

This untracked expiry means the shop loses money that could easily be saved. Implementing an expiry tracking system can help clear out soon-to-expire stock with quick sales or discounts, avoiding future waste and penalties.

Key Stats:

I have figured out some key statistics and values from the SHRI BALAJI MEDICAL STORE dataset that are provided in the table. These values are most prominent stats and overall data differs much from these facts.

Key Stats	Value
Total Revenue (Jan–May 2025)	292,759 Rs.
Average Daily Revenue	1,033.30 Rs.
Maximum Daily Revenue	8,820 Rs.
Minimum Daily Revenue	328 Rs.
Top Medicine by Revenue	Betadine 10g Ointment
Top Medicine Revenue Amount (Rs.)	111,840 Rs.
Top Medicine by Quantity	Crocin 500mg Tablet
Top Medicine Quantity Sold	1,022 units

Table3.1(Key Stats and value)

Main Results and Findings:

Revenue Performance: From January to 5th of May 2025, SHRI BALAJI MEDICAL STORE brought in a total revenue of 292,759 Rs. On an average, the store made about 1,033 Rs. each day, with daily earnings fluctuating between a low of 328 Rs. and a high of 8,820 Rs. This suggests that while there are days with exceptional sales most likely driven by bulk purchases or peak demand the store generally run consistent daily business.

Best-Selling Products:

By Revenue: The standout product was the Betadine 10g Ointment, which generated 111,840 Rs. This indicates a strong demand or premium pricing for this item, making it a key medicine in revenue generation.

By Quantity Sold: The Crocin 500mg Tablet topped the charts in units sold, with 1,022 tablets flying off the shelves. This reflects its popularity or necessity among customers, even though its revenue contribution is less than that of Betadine.

Sales Distribution: Interestingly, while Betadine is a high-revenue item, it doesn't lead in quantity sold, showcasing the different dynamics at play: some medicines are volume drivers, while others focus on value.

Stock & Sales Insights: The significant difference between the minimum and maximum daily revenues points to fluctuations in purchasing behaviour, with potential spikes on certain days possibly due to bulk orders, restocking, or local demand events.

● Interpretation of Results and Recommendation

Interpretation of Results:

1) Problem Statement and Business Context

SHRI BALAJI MEDICAL STORE operates in a competitive retail pharmacy environment, where both customer service responsiveness and inventory efficiency are critical for success. According to this analysis, the business challenge is twofold: sustaining profitable revenue growth while steering clear of operational pitfalls like stockouts, surplus, or an ill-coordinated approach to product assortment.

2) Dynamics of Sales and Revenue

The information, which covers the period from January to May 2025, shows that the store made about ₹292,759 in total revenue, which is a substantial amount for a single location during this time. Notably, daily sales figures fluctuate from a minimum of ₹328 to a maximum of ₹8,820 and an average of ₹1,033, indicating that revenue is not distributed equally on a daily basis.

Numerous operational and market factors can be blamed for this variability:

Market demand fluctuations can be brought on by publicity or special offers, seasonal shifts (such as the flu season), or illness outbreaks.

Stock Availability:

Unusual low revenue days could be related to supply delays or shortages of necessary items.

Wholesale Sales: Occasional spikes may reflect bulk or wholesale transactions, potentially from institutional buyers or rapid inventory replenishment.

These fluctuating sales patterns signal a need to strengthen the forecasting in pharmacy operations and also reactivity to fast pace changes in the weather.

3) Product Insights

A central finding is the divergence between the medicine driving the highest revenue (Betadine 10g Ointment, ₹111,840) and the medicine with the largest quantity sold (Crocin 500mg Tablet, 1,022 units). This indicates:

Revenue Concentration:

A small subset of high-value products disproportionately impacts total revenue. Losing availability of these can severely impact financial health.

Volume vs. Value:

Everyday staples may not earn as much per unit but are vital for drawing recurring customers and ensuring consistent footfall.

Pricing Power:

The store possibly enjoys higher pricing power in certain product categories (first aid, antibiotics) than in highly competitive and commoditized items.

4) Management of Stocks and Inventory

Best-sellers with steady stock reduce the risk of lost sales by adhering to operational best practices.

Variability, however, indicates room for improvement in:

- Inventory control (to avoid unintentional shortages)
- Actively placing new orders
- Working together with suppliers to ensure quick replenishment

5) Consequences for the Company

These findings have important significance:

Recurring business and customer trust are at risk for pharmacies that don't regularly stock in-demand medications.

Profit Optimization:

Prioritizing the purchase of high-value medications and utilizing their market positioning to maximize profits are essential.

Resource Allocation:

Staffing, marketing campaigns, and community outreach initiatives can all be better coordinated with an understanding of seasonality or demand waves.

Inventory Efficiency:

Working capital tied up in inventory can be decreased by cutting down on days of excess stock for slow-moving medications and switching to Just-in-Time principles for fastest-moving medications.

Detailed Actionable Recommendations:

1) Intelligent Inventory Management System

Specific:

Implement a comprehensive inventory management solution that automates reordering when stock hits certain levels and alerts the owner to potential shortages ahead of time.

Measurable:

Main goal is to cut down stockouts of the top 10 medicines by 90% over the next 90 days and keep an eye on fulfillment rates and order lead times through a new inventory management dashboard.

Achievable:

I'll leverage the store's current data to set up reorder points and expected lead times for each SKU.

Relevant:

Running out of stock on the best-selling and essential medicines can lead to lost sales and unhappy customers.

Time-bound:

I aim to have the entire system configured and training completed within 3 months, along with monthly check-ins to monitor the progress.

2) More Complex Demand Prediction

The store should forecast demand for all high-volume, high-value items two months in advance using recent sales data, going beyond averaging and gut feeling.

Take action:

Use a basic forecasting app, Excel, or Python to implement basic predictive analytics.

Impact:

Makes sure essential items like Crocin and Betadine are never understocked by anticipating upcoming surges (such as during seasonal illnesses or school openings).

Timeline:

Launch in two months, with ongoing improvement every three months. These improvements are based on the changing weather which is a key factor in demand spikes.

3) Adaptive Pricing and Marketing

Create bundled offers and targeted price promotions using sales analytics:

Try offering promotional discounts on necessary but slow-moving medications to increase turnover without lowering profit margins.

Increase the average transaction size by bundling low-profit, high-volume items (like Crocin) with related goods.

Impact:

Increases total revenue and offers customers who are price conscious value.

4) Program for Supplier Partnerships

For the fastest movers, look for supplier agreements that ensure top-up delivery windows of less than a week

Ask for bulk discounts, particularly for lead sellers like betadine and crocin.

Monitor supplier performance, including incomplete orders and delayed deliveries, and conduct a quarterly review.

Impact:

Increases negotiating power for better long-term terms, lowers emergency procurement costs, and improves availability.

5) Customer Engagement & Loyalty

Provide a points or reward system for loyal consumers, particularly parents of children's medications or chronic patients.

Gather feedback at the point of sale by asking customers to complete brief surveys to learn about unmet needs or items they wish were available.

Impact:

Increases brand loyalty and sets SHRI BALAJI MEDICAL STORE apart from surrounding rivals.

6) Slow-Moving and Expired Stock Control

Check the shelf inventory every three months for products that are about to expire or have already expired.

To reduce losses, use markdown techniques for products that are about to expire.

Orders from continuously slow sellers should be discontinued or reduced.

Impact:

Prevents regulatory problems caused by expired stock on shelves, minimizes capital waste, and frees up inventory for high-turnover items.

7) Employee Education and Operational Efficiency

Plan staff shifts according to peak sales analysis, with more employees on duty on days and times when sales have historically increased.

Every month, give a quick training on new procedures, customer service techniques, and product knowledge.

Although the store can be managed by the owner all alone but during seasonal time hiring staff could be helpful and it allows the owner to focus on management of stocks as the staff is there to handle sales.

Combined Recommendations and Benefits

- Short-Term Urgent Steps

Set up immediate inventory checks and automatic reordering for the top 10 medicines. Renegotiate with suppliers to speed up response times and get better cost prices.

Impact:

This will help us minimize lost sales from out-of-stock medicines. Customers will notice an improved experience and build trust with store right away.

- Medium-Term (3–6 Months)

Start using demand forecasting tools to better predict needs. Launch a loyalty program and a feedback system to hear from the customers.

Impact:

This lays the foundation for a service that is responsive and focused on the regular customers. It will help in gaining new data insights that can drive the business intelligence forward.

- Long-Term (6+ Months)

Regularly review and fine-tune the inventory and marketing strategies. Boost community involvement by organizing health camps and awareness programs.

Impact:

This will help in creating the store a trusted brand within the community. It will lead to sustainability, increase revenue and position the pharmacy as a healthcare partner, not just a retailer.

Effects & Advantages

There will be several business advantages to putting these suggestions into practice.

Improved Revenue and Margins:

Profit per particulars and sales opportunities are maximized by improved stock alignment and fewer stockouts.

Increased Client Attachment:

SHRI BALAJI MEDICAL STORE is the community's "first choice" due to its dependable medication availability and individualized approach.

Improved Cash Flow and Less Waste:

Good inventory management guarantees a healthy inventory turnover rate and reduces waste of the expired stock.

Data-Driven Culture:

Moves the business from reactive to proactive management, equipping staff for better day-to-day decisions and strategic planning.

Competitive advantage:

Sets the company apart from regional chains and internet competitors by providing specialized, reliable service.

Social Implications

In rural areas, the pharmacy is often more than a retailer—it is a source of healthcare advice and a center for community reassurance during health scares. The consistent sales of chronic disease medications (e.g., for blood pressure, diabetes), children's medicines, and basic wound care supplies suggest that the pharmacy is a daily essential for the local people. Moreover, maintaining affordable pricing and providing trusted recommendations can have a direct impact on community well-being and loyalty.

Having analysed the actual purchasing and sales data, the management can now move from a generic stocking approach to one guided by local health patterns, family sizes, agricultural schedules, and even specific village events (e.g., festivals, vaccination drives).

Expanded Recommendations (with Rural Focus):

- Local Health Outreach and Education
- Strengthen Relationship with Local Healthcare Providers
- Culturally Sensitive Inventory Management
- Build Loyalty Through Community Trust
- Emphasize Affordability and Accessibility
- Digital and Mobile Initiatives (Long-Term)
- Monitor Seasonal Patterns and Social Trends

Advantages of Implementation and Possible Effects

There are social and commercial advantages to modifying these suggestions for a rural setting:

Social Good:

Better access to timely, reasonably priced medications promotes long-term patronage and word-of-mouth recommendations while bolstering village public health. The pharmacy transforms from a store into a reputable local institution.

Economic Resilience:

Even in situations where purchasing power is seasonally limited, data-driven stocking that is in line with rural realities maximizes revenue, improves turnover, and minimizes waste.

Differentiation:

SHRI BALAJI MEDICAL STORE distinguishes itself from impersonal chains and traveling sales representatives who occasionally visit rural areas by emphasizing authentic community engagement.

Sustainable Growth:

The store is already regarded as a crucial pillar, drawing institutional bulk orders and potential collaborations as the village expands or new infrastructure (roads, schools, and clinics) is built.
